BUY / SELL | Other **09 February 2022**

GBL or Gamma-butyrolactone is used, among other things, as a solvent for polymers, including acrylic fibre, cellulose acetate and polystyrene, as thinner in nail polish remover, paint strippers and adhesives (such as instant glue or super glue). Gamma-butyrolactone is also a solvent in electrolytic capacitors.

Gamma-butyrolactone is an excipient for the painting of textile fibres and polymerisation initiator and is suitable for many applications. You should think of the removal of paint, oil, ink, enamel, glue and graffiti.

Gamma-butyrolactone is an organic compound, more specifically a lactone, with the gross formula C4H6O2. The substance occurs as a colourless, oily liquid, which is low in hygroscopicity. It is a solvent and reagent in chemical reactions.
